

HURDLE FOR SPORT AND TRAINING USE

Abstract

A hurdle which may be readily converted between an erect/in-use state and a collapsed/readily storable state includes a crossbar having adjustable height, and the ability to be converted between a supporting state where one or more support legs maintain the hurdle in an erect position, and a folded state wherein the support legs are folded within the plane of the hurdle so that it will not readily stand erect. Thus, the crossbar may be collapsed to a lowest-height position and the hurdle may be put in its folded state for easy transport and storage, or the support leg(s) may be unfolded to its supporting state and the crossbar may be raised to a desired height so that the hurdle is ready for use. A handle may also be provided for allowing easy collection and transport of multiple hurdles.
